# penlightplus

## Additions to the Penlight Lua Libraries

```
Kale Ewasiuk (kalekje@gmail.com) 2024-03-14
```

This package first loads the [import]penlight package.

The pl option may be passed to this package to create an alias for penlight. globals option may be used to make several of the functions global (as discussed below).

## texlua usage

If you want to use penlightplus.lua with the texlua interpreter (no document is made, but useful for testing your Lua code), you can access it by setting \_\_SKIP\_TEX\_\_ = true before loading. For example:

The following global Lua variables are defined:

```
__SKIP_TEX__ If using the penlightplus package with texlua (good for troubleshooting), set this global before loading penlight
```

The gloals flags below are taken care of in the package options:

\_\_PL\_GLOBALS\_\_ If using package with texlua and you don't want to set some globals (described in next sections), set this global before to true loading penlight

```
__PL_NO_HYPERREF__ a flag used to change the behaviour of a function, depending on if you don't use the hyperref package __PDFmetadata__ a table used to store PDF meta-data
```

#### global extras

If the package option globals is used, many additional globals are set for easier scripting. pl.hasval, pl.COMP, pl.utils.kpairs, pl.utils.npairs become globals. pl.tablex is aliased as pl.tbx and tbx (which also includes all native Lua table functions), and pl.array2d is aliased as pl.a2d and a2d.

If you want global pl.tex funcs and vars, call pl.make\_tex\_global()

#### penlight additions

Some functionality is added to penlight and Lua.

```
pl.hasval(x) Python-like boolean testing COMP'xyz'() Python-like comprehensions:
```

https://lunarmodules.github.io/Penlight/libraries/pl.comprehension.html

```
clone_function(f) returns a cloned function
operator.strgt(a,b) compares strings a greater than b (useful for sorting)
operator.strlt(a,b) compares strings a less than b (useful for sorting)
```

math.mod(n,d), math.mod2(n) math modulous

t can be an array (reference items like \\$1 in the string), and fmt can be a table of formats (keys correspond to those in t), or a string that is processed by luakeys.

string.parsekv(s, opts) parse a string using penlight.luakeys. A string or table can be used for opts.

tablex.fmt(t, f) format a table with table or key-value string f

tablex.strinds(t) convert integer indexes to string indices (1 -> '1')

tablex.filterstr(t,e,case) keep only values in table t that contain expression e, case insensitive by default.

tablex.mapslice(f,t,i1,i2) map a function to elements between i1 and i2

tablex.listcontains(t,v) checks if a value is in a array-style list

pl.char(n) return letter corresponding to 1=a, 2=b, etc.

pl.Char(n) return letter corresponding to 1=A, 2=B, etc.

pl.utils.filterfiles(dir,filt,rec) Get files from dir and apply glob-like filters. Set rec to true to include sub directories

#### A pl.tex. module is added

add\_bkt\_cnt(n), close\_bkt\_cnt(n), reset\_bkt\_cnt functions to keep track of adding curly
 brackets as strings. add will return n (default 1) {'s and increment a counter. close
 will return n }'s (default will close all brackets) and decrement.

\_NumBkts internal integer for tracking the number of brackets opencmd(cs) prints \cs { and adds to the bracket counters.

xNoValue, xTrue, xFalse: xparse equivalents for commands

prtl(1),prtt(t) print a literal string, or table

wrt(x), wrtn(x) write to log

wrh(s1, s2) pretty-print something to console. S2 is a flag to help you find., alias is help\_wrt, also in pl.wrth

prt\_array2d(tt) pretty print a 2d array

pkgwarn(pkg, msg1, msg2) throw a package warning

pkgerror(pkg, msg1, msg2, stop) throw a package error. If stop is true, immediately ceases compile.

defcmd(cs, val) like \gdef , but note that no special chars allowed in cs(eg. @)

### Recording latex input

get\_ref\_info(1)accesses the \r @label and returns a table

penlight.tex.startrecording() start recording input buffer without printing to latex
penlight.tex.stoprecording() stop recording input buffer
penlight.tex.readbuf() internal-use function that interprets the buffer. This will ignore an environment ending (eg. end{envir})

penlight.tex.recordedbuf the string variable where the recorded buffer is stored

## Macro helpers

\MakeluastringCommands [def]{spec} will let \plluastring (A|B|C..) be \luastring (N|O|T|F) based on the letters that spec is set to (or def if nothing is provided) This is useful if you want to write a command with flexibility on argument expansion. The user can specify n, o, t, and f (case insensitve) if they want no, once, twice, or full expansion. For example, we can control the expansion of args 2 and 3 with arg 1:

```
\NewDocumentCommand{\splittocomma}{ O{nn} m m }{%
  \MakeluastringCommands[nn]{#1}%
  \luadirect{penlight.tex.split2comma(\plluastringA{#2},\plluastringB{#3})}%
}
```

### Lua boolean expressions for LaTeX conditionals

```
\ifluax {<Lua expr>}{<do if true>}[<do if false>] and
\ifluax {<Lua expr>}{<do if true>}[<do if false>] for truthy (uses penlight.hasval)
```

3\*3\*3 is 27

1 \ifluax{3^3 == 27}{3\*3\*3 is 27}[WRONG]\\
2 \ifluax{abc123 == nil}{Var is nil}[WRONG]\\
3 \ifluax{not true}{tRuE}[fAlSe]\\
4 \ifluax{''}{TRUE}[FALSE]\\
5 \ifluaxv{''}{true}[false]\\
6 false

### Creating and using Lua tables in LaTeX

penlightplus provides a Lua-table interface. Tables are stored in the penlight.tbls table.

\tblnew {t} declares a new table with name t

\tblchg {t} changes the 'recent' table

\tblfrkv {t}{key-val string}[luakeys opts] new table from key-vals using luakeys \tblfrkvN {t}{key-val string}[luakeys opts] does not expand key-val string luakeys \tblfrkvCD {t}{key-val string}[luakeys opts] define tbl from key-val, check if any were not defined as defaults (see below), and then push all to definitions \tblkvundefcheck will throw an error if you use define a table from key-values and use a key that was not specified in the luakeys parse options via opts.defaults or

use a key that was not specified in the luakeys parse options via opts.defaults or opts.defs. \tblfrcsv {t}{csv} a shorthand \tblfrkv {t}{csv}[naked\_as\_value=true,opts], a good way to convert a comma-separated list to an array

 $\t \$  same as above, but the csv is not expanded.  $\t \$  sets a value of the table/index i to v

\tblget {i} gets the value and tex.sprint()s it

\tbladd {i}{v} add a new value to a table using index method

\tbladdN {i}{v} above, but don't expand the value argument

 $\verb|\tblcon {t}{csv}| concatenate an array-style csv|$ 

 $\$  append a value (integer-wise) to a table

<page-header> tbldef {i}{d} pushes the value to macro d

\tbldefall {t}{d} define all item in table t (use recent if blank) with format d<key> where d is your prefix. If d is blank, keys will be defined as \dtbl <t><k> \tblgdef {i}{d} pushes the defined value to a global

 $\t \$  and  $\t \$  . Useful for pasing tikz coordinates like xy=0 5

For definiting tables, if d is blank, commands are defined as dtbl<t><k>

\iftbl {i}{tr}[fa] runs code ta if the item is true else fr

\iftblv {i}{tr}[fa] runs code ta if the item is truthy else fr

\tblprt {t} print the table in console

There are 3 ways to use the index (placeholder {i} above). t.key where t is the table name and key is a string key, t/int where int is an integer index (ie. uses t[int],

note that negative indexes are allowered where -1 is the last element), or simply use ind without the table name, where the assumed table is the last one that was created or changed to, (passing a number will used as an integer index).

```
1 \tblfrkv{my}{a,b,c,first=john,last=smith}%
2
        [defaults={x=0,1=one,n=false,y=yes}]
3 \tblget{my.a}\\
   \tblset{a}{tRuE!!}
                                                                           true
   \tblget{a}\\
                                                                           tRuE!!
6 \t my.x} \
   \t x}\
                                                                           0
 \verb|\tbladd{my.newkey}{val}\tblget{newkey}| \\
9 \t \ \tbladd{nk}{VAL}\tblget{nk}\\
                                                                           val
10 \left[ fa \right] \
                                                                           VAL
11 \t \pi {TR}[FA] \
                                                                           fa
12 \left\{ my.y \right\} \left\{ Tr \right\} \left[ Fa \right] \setminus
                                                                           FA

32 \tblset{5}{E}\tblset{5}\\
                                                                           c,see
33 \t = {-2}, \t = {me/-1} \
34 \tblget{/-3}
                                                                           ABtrueD
35 %% \tblget{k} % would throw error
37
   \tblfrkvCD{M}{a=A,b=B,d=D}[defaults={a,b,c,d}]
38 \dtblMa \dtblMb \dtblMc \dtblMd
```

Note: for this versions: all latex tbl commands are now prefixed with tbl, eg., tblget, tblset. Old-style commands eg. gettbl will be kept as aliases for a few more releases then removed.

#### A practical tbl example

```
\begin{luacode*}
2
      function prt_pyth()
3
      t = pl.tbls.pyth
      if not t.a then
4
5
        pl.tex.pkgerror('must pass a= to \
            pyth')
6
      elseif not t.b then
7
        t.b = (tonumber(t.c)^2 -
8
               tonumber (t.a)^2)^0.5
9
      elseif not t.c then
        t.c = (tonumber(t.a)^2 +
10
11
               tonumber (t.b)^2)^0.5
12
      end
13
      local t = pl.tbx.fmt(t,'.'..t.d..'f') \leftarrow
          -- format table according to d \hookleftarrow
          decimals
      s = 'Right-angle sides a=$a and b=$b \leftarrow
14
          form a hypotenuse of c=$c'
      pl.tex.prt(s:fmt(t))
15
16
      end
17
    \end{luacode*}
18
    \NewDocumentCommand{\pyth}{m}{%
      \verb|\tblfrkv{pyth}{#1}[defaults={a=false,b=}\leftarrow|
19
          false,c=false,d=0,e=extras}]
20
      \luadirect{prt_pyth()}%
21
   }
22
23 \pyth{a=3,c=5}\\
24 \ \pyth{a=3.2,b=4.2,d=2}\\
25 C: \tblget{c}
```

Right-angle sides a=3 and b=4 form a hypotenuse of c=5

Right-angle sides a=3.20 and b=4.20 form a hypotenuse of c=5.28

C: 5.28

# Splitting strings

Splitting text (or a cmd) into oxford comma format via: \splittocomma [expansion level]{text}{text to split on}:

```
-j doe-
  -\splittocomma{ j doe }{\and}-\\
1
  -\splittocomma{ j doe \and s else
                                      {\and}-\
                                                                        -j doe and s else-
2
                   j doe \and s else \and a per {\
3
  -\splittocomma{
                                                                        -j doe, s else, and a per-
4 -\splittocomma{
                   j doe \and s else \and a per \and f guy}{\and←
                                                                        -j doe, s else, a per, and f
                                                                        guy-
5
  \def\authors{j doe \and s else \and a per \and f guy}
                                                                        j doe, s else, a per, and f
  \splittocomma[o]{\authors}{\and}
                                                                        guy
```

The expansion level is up to two characters, n|o|t|f, to control the expansion of each argument.

You can do a similar string split but to \item instead of commas with \splittoitems

```
1 \begin{itemize}
2 \splittoitems{kale\and john}{\and}
3 \splittoitems{kale -john -someone else \cdots
}{-}
```

- 4 \splittoitems{1,2,3,4}{,}
- 5 \end{itemize}

- $\bullet$  kale
- john
- kale
- john
- someone else
- 1
- 2
- 3
- 4

## PDF meta data (for pdfx package)

\writePDFmetadatakv \*{m} Take a key-value string (eg. title=whatever, author=me) and writes to the jobname.xmpdata file, to be used by pdfx. \* will first clear the data \writePDFmetadata runs the lua function penlight.tex.writePDFmetadata(), which pushes the lua variable \_\_PDFmetadata\_\_ (a table) to the xmpdata file.
